Florian Pronold (Managing Director Institut Bauen und Umwelt e.V.)	Sr Lucas Berman, (Independent verifier)						

# **Product**

### Product description/Product definition

Sika's Polypropylene-based fibres are available in macro, micro, and blended forms. They are primarily used to improve the load-carrying capacity of concrete and to enhance its resistance to plastic shrinkage cracking, impacts, and shattering. They also help reduce rebound waste, allow for thicker layer builds, and minimize sag in shotcrete applications. This EPD is valid for the following Sika's Polypropylene-based fibres in micro forms:

- Sika<sup>®</sup> Confibre<sup>®</sup> 51F
- Sika® Fibermesh®-150
- Sika<sup>®</sup> Confibre<sup>®</sup> 19F
- SikaFiber<sup>®</sup>

For the placing on the market of the product in the European Union/European Free Trade Association (EU/EFTA) (with the exception of Switzerland) Regulation (EU) No. 305/2011 (CPR) applies. The product needs a declaration of performance taking into consideration EN 14889-2:2006, Fibres for concrete - Part 2: Polymer fibres - Definitions, specifications and conformity and the CE-marking.

For the application and use the respective national provisions apply.

## Application

For most types of concrete to increase load-bearing capacity, improve resistance to plastic shrinkage cracking, and reduce brittle damage caused by impact and fire:

- · Floor slabs.
- · Precast concrete elements,
- Foundations, footings,
- Tunnelling, mining, pools shotcrete,
- Load-bearing components in building construction and traffic route engineering.

Polypropylene-based micro fibres shall be mixed with a high-efficiency mixer, at the recommended dosage, and for an adequate duration (typically a minimum of 5 minutes) to ensure uniform distribution of the fibres throughout the concrete mix. The entire package can be thrown into the mix allowing for easy handling whilst leaving no waste on site. Fibres can be added to the mix at any stage during batching.

The addition of polypropylene-based micro fibres can cause a reduction of the concrete consistency. It is recommended to correct this loss not by adding water, but by adjusting the mix to the required workability, with a suitable dosage of Sika® water reducing admixture (SikaPlast® or ViscoCrete® range). Polypropylene-based micro fibres are also compatible with all other concrete admixtures and performance-enhancing chemicals.

# **Technical Data**

All technical data stated in this document are based on laboratory tests. Actual measured data may vary due to circumstances beyond our control.

Name	Value	Unit
Sika® Confibre® 51F		
- Density	0.91	kg/l
- Diameter	0.055	mm
- Length	51	mm
- Classification acc. to EN 14889-2	lb	-
- Melting point	160	°C
- Tensile strength acc. to EN 14889-2	~310	MPa
- Modulus of elasticity in tension acc. to EN 14889-2	>3.5	GPa
- Recommended dosage	0.9– 2.0	kg/m <sup>3</sup>
Sika® Fibermesh®-150		
- Density	0.91	kg/l
- Diameter	0.03	mm
- Length	12	mm
- Classification acc. to EN 14889-2	la	-
- Melting point	162	°C
- Tensile strength acc. to EN 14889-2	~310	MPa
- Modulus of elasticity in tension acc. to EN 14889-2	>3.5	GPa
- Recommended dosage	0.9– 2.0	kg/m <sup>3</sup>
Sika® Confibre® 19F		
- Density	0.91	kg/l
- Length	19	mm
- Diameter	0.1	mm
- Classification acc. to EN 14889-2	lb	-
- Melting point	160	°C
- Tensile strength acc. to EN 14889-2	~310	MPa
- Modulus of elasticity in tension acc. to EN 14889-2	>3.5	GPa
- Recommended dosage	0.9– 2.0	kg/m <sup>3</sup>
SikaFiber®		
- Density	0.91	kg/l
- Length	18	mm
- Diameter	0.035	mm
- Classification acc. to EN 14889-2	la	-
- Melting point	160	°C
- Tensile strength acc. to EN 14889-2	>450	MPa
- Modulus of elasticity	>3.5	GPa
- Recommended dosage	0.6– 2.0	kg/m <sup>3</sup>
Performance data of the product in accordance v	-1	•

Performance data of the product in accordance with the declaration of performance with respect to its essential characteristics according to *EN 14889-2:2006, Fibres for concrete - Part 2: Polymer fibres - Definitions, specifications and conformity.* 

## Base materials/Ancillary materials

Polypropylene-based micro fibres consist of the following:

Name	Value	Unit
Polypropylene	> 95	%
Additive(s)	< 5	%

1) This product/article/at least one partial article contains substances listed in the *ECHA candidate list* (date: 26.09.2024) exceeding 0.1 percentage by mass:

# **BUILDING TRUST**

- Nc
- 2) This product/article/at least one partial article contains other cancerogenic, mutagenic, reprotoxic (CMR) substances in categories 1A or 1B which are not on the *ECHA candidate list*, exceeding 0.1 percentage by mass:
  - No
- 3) Biocide products were added to this construction product or it has been treated with biocide products (this then concerns a

treated product as defined by the *Regulation (EU) on biocidal products*):

• No

#### Reference service life

A reference service life according to the *ISO* 15686:1, -2, -7 and -8 standards cannot be declared as the fibres are fully integrated into concrete. Their service life thus depends on the service life of the concrete structure they are used in.

# LCA: Calculation rules

#### **Declared Unit**

The declared values are valid for 1 kg of Polypropylene-based micro fibres, commercialised in Australia by Sika Australia Pty Ltd.

#### **Declared unit**

Name	Value	Unit
Declared unit	1	kg

The declared values represent an average weighted by production volume across all products covered in this EPD. For the production process alone (without transport to Australia), the values across all indicators vary between 69 % and 131 % for all products covered in this EPD, whereas specifically the GWP $_{\rm fossil}$  varies between 94 % and 106 %.

The production process itself is not related to significant emissions; hence, the environmental impact is caused in upstream and downstream processes.

# System boundary

**Type of the EPD**: from the cradle to gate, i.e. A1-A3. In addition, the current average transport from the Sika warehouses to the concrete production plant (module A4) as well as the disposal of packaging (module A5) are declared for informative purposes.

The system boundaries related to non-elementary flows entering or leaving the product system are outlined below:

- Plastic materials (production waste and packaging) that are recycled, reach the end-of-waste state once they are sorted into homogeneous fractions.
- Cardboard and paper packaging that is recycled, reaches the end-of-waste state once it is sorted into homogeneous fractions.
- For wooden packaging materials that are recycled, the end-of-waste state is reached after sorting and chipping/crushing.

For all recycled materials, transport to further processing is included as a conservative choice.

The content of the modules declared in this EPD are outlined in the next section below.

**Modules A1-A3** includes the production of the Sika's polypropylene-based fibres. The raw materials are transported to the production site, where they are extruded, wound and cut to size; off-cuts are shredded and recycled closed-loop into the extrusion process. The fibres are then packed for transport and transported from the production site to warehouses in Australia. Hence, modules A1-A3 include all upstream and downstream processes related to the provision of raw materials, packaging and ancillary materials, their transport to the production sites, electricity, generation, waste treatment, etc.

**Module A4** covers for informative purposes, the average transport for the year 2023:

- · between different warehouses in Australia,
- the final transport to the concrete producer.

**Module A5\*** contains the modelling of the disposal of the packaging from the production site of the concrete, where the fibres are used as reinforcement.

The following disposal routes are common for the different packaging materials of polypropylene fibres in Australia:

- all polyvinyl acetate water-soluble wrappings, paper bags and paper boxes are mixed within concrete during application (not to generate any waste)
- stretch wrap/plastic packaging around the pallet: landfill
- other cardboard/paper (e.g. corner post): recycling
- · pallets in Australia: they are all reused
- · other wood: landfill

# **Geographic Representativeness**

Land or region, in which the declared product system is manufactured, used or handled at the end of the product's lifespan: Australia

### Comparability

Basically, a comparison or an evaluation of EPD data is only possible if all the data sets to be compared were created according to *EN 15804* and the building context, respectively the product-specific characteristics of performance, are taken into account.

Ecoinvent v3.10 has been used as the background database.

# LCA: Scenarios and additional technical information

# Characteristic product properties of biogenic carbon

# **Characteristic product properties**

Information on biogenic carbon

Name	Value	Unit
Biogenic carbon content in product	0	βC
Biogenic carbon content in accompanying packaging	0.0579	kg C

Note: 1 kg of biogenic carbon is equivalent to 44/12 kg of CO<sub>2</sub>.

# Module A4 "Transport to the user of the polypropylene fibres"

For the internal logistics between different Sika warehouses in Australia and the transport from the Sika warehouses to the user of the polypropylene fibres for concrete production, an average distance of 1031 km by truck, 607 km by train and 19 km by ship have been inventoried as being representative for

the year 2023.

Module A5\* "Disposal of packaging after usage of the product"

This module contains the disposal of the packaging only. For material to be recycled, an average transport distance of 500 km is assumed; for material to be landfilled, an average transport distance of 100 km is assumed.

Given that the end-of-life scenario could be a permanent

storage of the fibres in tunnel applications and in order to ensure a net 0 carbon balance for the biogenic carbon stored in the product, the (permanent) biogenic carbon storage in packaging material is neglected in line with *EN 15804+A2* (in analogy to biogenic carbon in landfills).

No bonding agent is needed during concrete production.

# LCA: Results

Disclaimer 1 – for the indicator 'Potential Human exposure efficiency relative to U235'. This impact category deals mainly with the eventual impact of low-dose ionizing radiation on human health of the nuclear fuel cycle. It does not consider effects due to possible nuclear accidents, occupational exposure or radioactive waste disposal in underground facilities. Potential ionizing radiation from the soil, radon and from some construction materials is also not measured by this indicator.

Disclaimer 2 – for the indicators 'abiotic depletion potential for non-fossil resources', 'abiotic depletion potential for fossil resources', 'water (user) deprivation potential, deprivation-weighted water consumption', 'potential comparative toxic unit for ecosystems', 'potential comparative toxic unit for humans – cancerogenic', 'Potential comparative toxic unit for humans – not cancerogenic', 'potential soil quality index'. The results of this environmental impact indicator shall be used with care as the uncertainties on these results are high as there is limited experience with the indicator.
